

Foundations of programming

Intro

Francesco Corona

CK0030
FdP

FdP - When and where

Analogical when and where

- **TUE: 08:00-10:00** [was: 07:00-10:00]
- **THU: 08:00-10:00**

- **TUESDAYS:** Bloco 951, Sala 11 [was: Bloco 950, Sala 3]
- **THURSDAYS:** Bloco 951, Sala 11 [was: Bloco 950, Sala 1]

Online, where things happen

- Website: [Foundations of programming](#) (click me)
- SIGAA: [SIGAA](#) (click me)

Remark

The course website is the main communication channel

FdP - Material

Computer programming using Python and math/physics examples

Lectures and material are mostly based on a textbook

- *A primer on scientific programming with Python: 4th and/or 5th Edition*, by Hans Petter Langtangen

↪ [Book website](#)

Remark

Course slides and notebooks will suffice

FdP - Material (cont.)

Other primary (but not necessarily required) references

The [official Python documentation](#) page

- Tutorials, library and language references

The collection of [Python books](#)

- *Python essential reference*, by D. Beazley
- *Learning Python and Programming Python*, by M. Lutz
- *Computing with Python - An introduction to Python for science and engineering*, by C. Fuerher, J. E. Solem and O. Verdier
-

FdP - Content (cont.)

The actual course content

- Intro to variables, objects, modules, and text formatting
- Programming with WHILE- and FOR-loops, and lists
- Functions and IF-ELSE tests

- Data reading and writing
- Error handling
- Making modules

- Arrays and array computing
- Plotting curves and surfaces

Remark

These are the core blocks of the course

- Blocks are strongly related

FdP - Content

Why the Python programming language because?

It combines expressive power with clean, simple, and compact syntax

- Easy to learn, well suited for an introduction to coding
- Similar to MATLAB, a language for math computing
- Easy to combine Python with compiled languages (Fortran, C, and C++, widely used for scientific computations)

FdP - Content (cont.)

Example formulas are first introduced and then primitively computed

- Formulas are firstly used to produce tables of numbers
- Formulas are encapsulated in sophisticated functions

Function inputs are user-provided and fetched from command line

- Validity checks of the input are performed

The result of computing formulas are shown as graphs

FdP - Content (cont.)

Remark

After the blocks, you should have enough knowledge of programming

- You will be able to solve mathematical problems
- In a so-called 'MATLAB-style' way of coding

Class programming, including user-defined types for math computations

- Object-oriented programming (class hierarchies and inheritance)
- In the end of the course, if and only if time allows

FdP - Evaluation (cont.)

Each of you must hand in his/her own answers

- Homeworks must be done **individually**

Also, each of you must write his/her own code

Remark

It is acceptable, however, for you to **collaborate** in figuring out answers

- We assume that you take the responsibility to make sure you personally understand the solution to any collaborative work²

As part of the evaluation, we will request you to **defend your homework**

²Though, you must always indicate on each homework with whom you collaborated.

FdP - Evaluation

We use problem sets covered by books, papers, blogs, webpages, ...

- We expect you **not to copy**, refer to, or look at the solutions
- We expect you to **want to learn** and not google for answers¹

Remark

The purpose of problem sets is to **help you think** about the material

- Not give us the right answers, 'cause we know them

¹If you happen to use other material (we know you will), such material must always be acknowledged with a **citation** on the submitted solution. To avoid making a laughing stock of yourself, it is important that you check the **correctness** of the copied solution.

FdP - Evaluation (cont.)

To typeset assignments, you are encouraged to use the template \LaTeX ³

- Download me [here](#)
- Check me out [here](#)

³ \LaTeX ? Yes, \LaTeX !

FdP - Evaluation (cont.)

Assignments must be returned **before deadline** via SIGAA

- You'll get notified of the opening of a new task

Delayed submissions are emailed to the teaching assistant

Remark

Delays will be penalised

- [00h, 24h), -20% of the grade;
- [24h, 48h), -40% of grade;
- ...

Accessing Python

Technical topics

Accessing Python

A Python system for scientific computing used to be difficult to install

- This problem is more or less solved today

There are several options for getting easy access to Python

- The biggest issue is to make a choice

Accessing Python (cont.)

Strictly required software

- **Python**, version 2.7.x
- **NumPy**, array computing
- **Matplotlib**, plotting

Desired software packages

- **IPython**, iterative computing
- **SciTools**, add-ons to numpy
- **SymPy**, symbolic mathematics
- **SciPy**, advanced mathematics
- ...

If you get interested

- **pytest** or **nose**, code testing
- ...

Accessing Python (cont.)

These software and software packages need to run on either

- UFC computers (ask admins about it)
- Your computers (install that stuff)
- A web service (OK, to start only)

GNU/Linux, Mac OSX and Windows offer various possibilities

- You can install each individual package (very system dependent)
- You can install a pre-built environment ([Anaconda](#), [Canopy](#), ...)

Accessing Python (cont.)

Remark

- You have a Windows computer, get rid of Windows and install a Debian distribution of GNU/Linux
- You have a Windows computer and you really really like it, split the drive and install Debian
- You have a Windows computer and you really really really like it, ask the teaching assistant (and a doctor)

- You have a Mac OSX computer, get rid of Mac OSX and install a Debian distribution of GNU/Linux
- You have a Mac OSX computer and you really really like it, split the drive and install Debian
- You have a Mac OSX computer and you really really really like it, keep it and install Anaconda

- You have a GNU/Linux computer, make it Debian, apt-get install the stuff and get rolling

Typing code

Technical topics

Typing code

Code consist of plain text, a program to store text in a file is needed

For writing code you need special programs, called **text editors**

- They preserve exactly the characters you type

Word-type programs aim at producing sort-of-nice-looking reports

- Text formatting, not code

A text editor

Typing code

A text editor

Some of the most widely used editors for writing programs

- **Atom**, **Sublime Text**, **Emacs**, and **Vim**

They are available on all major platforms

Some simpler alternatives

- GNU/Linux: **Gedit/Pluma**
- Mac OSX: **TextWrangler**
- Windows: **Notepad++**

Remark

Python comes with **Idle**, it is its own editor used to write programs

A text editor

Spyder is a graphical application for developing/running Python programs

- It is available on all major platforms
- Spyder comes with Anaconda

Also available in other pre-built environments for (scientific) computing

Spyder window contains a plain **text editor** and a **shell** to run programs

- A **file browser** and a display for **documentation**

Executing code

Technical topics

Executing code

Remark

To run a Python program, you need a **terminal window**

- This is the window where you issue commands
- ↪ Unix commands in GNU/Linux and Mac OSX
- ↪ DOS commands in Windows

In a terminal window, one first moves to the right folder,

- There one executes code (`prog.py`)
- By typing `python prog.py arg1 arg2`

Whatever the program prints can be seen in the terminal window

The (interactive) shell

Executing code

The (interactive) shell

The second simplest way of executing a Python program is **IPython**

- You start IPython by command `ipython` in a terminal window
- (by double-clicking the IPython icon, on Windows)
- Run a program (`prog.py`) by typing `run prog.py arg1 arg2`

Remark

Executing Python code in IPython works the same on all platforms

Notebooks

Executing code

Notebooks

A **IPython notebook** is an interactive tool for developing Python code

- You can either run it locally on your computer or in a web service

Remark

The interface to a notebook is a **web browser**

You see all the results in the browser window

Web services

Executing code

Web services

You can **avoid installing Python** on your personal machine

- Web services allow you to write/run Python code

There are excellent web services with notebooks

- <https://cloud.sagemath.com>
- ~> SageMathCloud

Remark

You must **create an account**

- You can write notebooks in a browser
- You can then download them
